

## Module Review

Reviewers identify and document the grammar, spelling, navigation, and functionality errors they find.

### What You Get

Customers receive access to a per-screen listing of the errors found. The list will be available online for thirty days. Customers will be able to edit the list on the portal and/or use it as a checklist as they make changes to the source file. Customers will also be able to export the list into .csv format.

### Additional Module Review Services

You'll be able to add additional services to your order.

SERVICE	DESCRIPTION
<b>Intra-module Consistency Report</b>	Reviewers look for terminology inconsistencies in spelling, formatting, and usage. They also look for inconsistencies in functionality, navigation, behavior, and visual appearance.
<b>Style Consistency Report</b>	Reviewers look for items inconsistent with a common style chosen by the client (APA, MLA, Chicago, other), or a custom style provided by the client. If requested, reviewers can also check for technical terminology choices inconsistent with the Microsoft Manual of Style.
Customers receive a report that includes a per-page listing of recommendations for making the module more consistent with their preferred style.	
<b>Multi-device/OS Testing</b>	Reviewers will test your module on multiple device and operating system pairings chosen by the client. They will report back with any identified problems.

### Why Get a Module Review

- It's difficult to simultaneously proofread and test online modules – especially for the developer who created the modules.
- The client can focus on getting the content right when there are fewer navigation and functionality errors.
- Reduce the number of review cycles for you and your client.
